

Pacbrake PowerHalt Plus (PH+) Electronic Air Shutoff System is an electronically controlled emergency engine shut down system which forces engine shut down by blocking an engine's air intake path. Automatic shutdown is achieved by actuating the engine's existing electronic throttle unit if engine speed exceeds the pre-set speed or by manual override. The valve electronically returns to open position after emergency engine shutdown, all while providing feedback to the operator that the valve is held closed via an illuminated switch.

Product Highlights

- Reliable and safe emergency shut down for diesel engines with electronic throttle body
- Operator friendly fully automatic operation with manual override
- IP67 rated seal against water ingress
- Secondary Trip Speed for Power Take Off (PTO) and/or anti-theft applications
- Low power consumption with smart control
- Multiple built-in shutoff speeds

PowerHalt PH+ Kits

PH+ Kit Contents and Applications

PowerHalt PH+ Kits contain all the necessary components needed for a simple plug and play installation. Install can generally be completed in less than 60 minutes for most applications and the system can be uninstalled in similar time if removal is required, such as for truck lease returns. All PH+ kits feature:

- PowerHalt PH+ Controller providing Automatic engine shutdown in emergency situations
- Common Wiring Harness to provide system power and manual activation control for all applications
- Speed Signal and Valve Control Harness with vehicle specific factory connectors
- In-Cab Toggle Switch for manual shutdown included

Kit Number	Make	Year	Style	Engine	
C50317A	Dodge / Ram	2007 - 2009	Pickup	Cummins 6.7L	
		2007 - 2010	Cab and Chassis		
C50318A		2010 - 2018	Pickup		
		2011 - 2018	Cab and Chassis

PowerHalt PH+ Control

Controller

PowerHalt PH+ Controller monitors engine speed via engine crankshaft signal and will automatically trigger the factory electronic throttle body to close and shut down the engine when programmed trip speed is exceeded. The controller has a fixed number of selectable trip speeds or emergency shutdown can be activated at any time through a manual override toggle. All control and programming are completed using the toggle switch and harness mounted mode selection connector.

- Capable of shutting down engine automatically via overspeed signal or manually via toggle switch
- Capable of shutting down at a secondary trip speed for special applications such as protection of PTO equipment or as an anti-theft device
- Valve remains closed for minimum 15 seconds after tripping and will hold closed until removal of shut-down signal
- When valve is closed, supplied switch light illuminates to indicate system activation
- Valve will electronically reset and switch light will extinguish upon removal of engine shut-down signal
- Secondary trip speed for PTO and anti-theft applications – providing ground to the Secondary Trip Speed input allows users to engage a second emergency shut-down speed for use while powering auxiliary equipment or to prevent theft. To prevent accidental shut down while enabling and disabling Secondary Trip Speed, a 5 second grace period is applied when switching to a lower trip speed to allow for engine speed to reduce. When switching to a higher trip speed, the change is applied immediately.

Part Number	C20640
Controller Voltage	Battery Voltage, 12 VDC Nominal (9 – 14 VDC)
Seal Rating	IP67, IP69K
Ambient Temperature Range	-40°C to +85°C [-40°F to +185°F]
Vibration	8 G _{rms}
Valve Activation Duration	15 seconds minimum
Current Consumption, Idle (12VDC, Nominal)	17.5 mA @ 12 VDC
Current Consumption, Activation	9.5 A MAX @ 14 VDC
PTO Input Signal (Secondary Activation Signal) [Connector B, Pin 3]	Ground
Installation Torque	1.13 to 1.36 Nm [10 to 12 in-lbf]

Wiring Harnesses

Common Wiring Harness (Harness A)

The Common Wiring Harness supplies power to the PH+ system and is used to control valve activation by means of a toggle switch or through PTO activation. The harness controls the PH+ system mode through a jumper connector and provides user feedback through an LED indicator for system programming and valve activation status.

Temperature Range	-40°C to +105°C [-40°F to +221°F]
Sealed Connectors	Yes
Flammability Rating	FT2
RoHS Compliant	Yes
Environmental Resistance	Fuel, oil, and solvent compatible
Wiring	SAE J1128, Tinned Copper Conductor

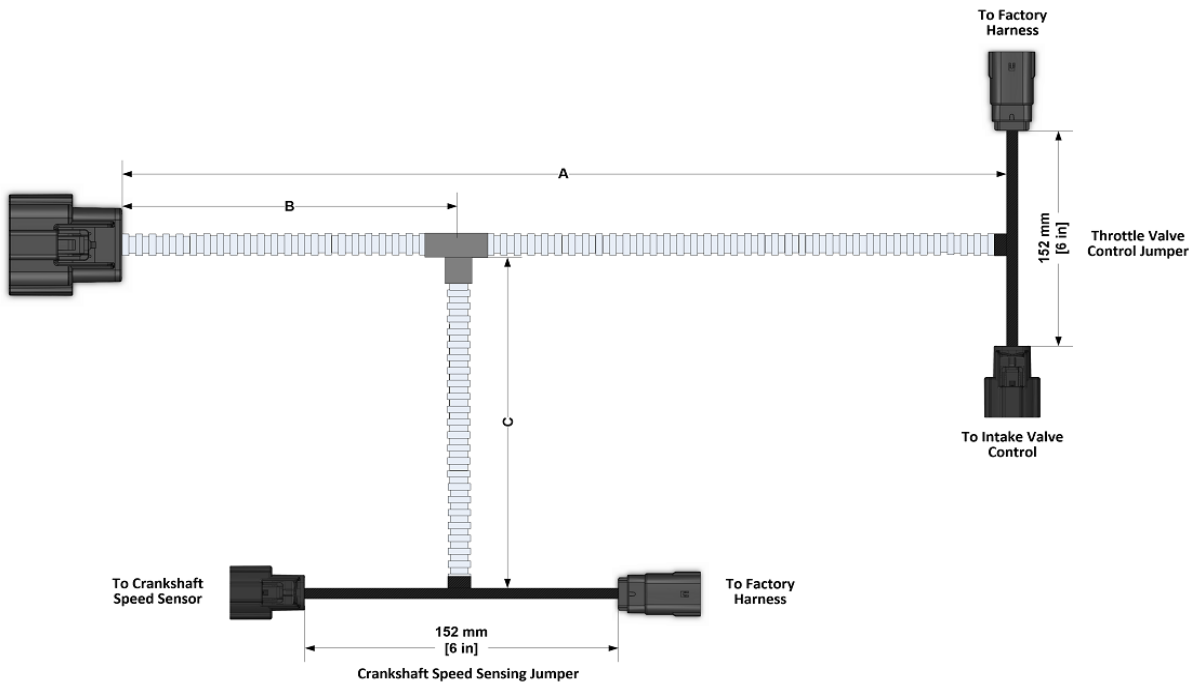

Part Number	C20630
Overload Protection	In-line 15A Mini Fuse
System Mode Selection	Jumper Connected: Run / Operation Mode Jumper Disconnected: Set / Test Mode

If extending wiring harness lengths, individual runs must not extend beyond 6 meters [20 feet] from controller. Use sealed connections and specified wire type & size. See Installation Manual for details.

Speed Signal and Valve Control Wiring Harness (Harness B)

The Speed Signal and Valve Control Wiring Harness is used to supply a speed signal to the PowerHalt PH+ system and control the electronic throttle valve position. The harness is available with application specific connectors and lengths customized to your model year and engine.

Temperature Rating (Continuous)	-40°C to +105°C [-40°F to +221°F]
Sealed Connectors	Yes
Flammability Rating	FT2
RoHS Compliant	Yes
Environmental Resistance	Fuel, oil, and solvent compatible
Wiring	SAE J1128, Tinned Copper Conductor, 18 AWG

Control Accessories

Toggle Switches

A momentary toggle switch with LED indicator is required to activate and program PH+ systems. An illuminated switch with protective toggle cover is the standard option. A latching toggle switch may be used with the PTO function for special applications such as theft prevention or protection of PTO equipment. All available options are listed below.
